

United States Department of Agriculture Natural Resources Conservation Service

Ecological Site Description

Site Type: Rangeland

Site Name: Loamy (Ly), 15-19" P.Z., Foothills and Mountains West

Site ID: R043BY222WY

Major Land Resource Area: 43B-Central Rocky Mountains

Physiographic Features

This site occurs on gentle to steep mountain slopes, valley bottoms, and steep glacial moraines. It is found on all exposures at high elevations, but primarily on north and east slopes at lower elevations.

Landform: Hill sides, alluvial fans, ridges & stream terraces

Aspect: all

	<u>Minimum</u>	<u>Maximum</u>	
Elevation (feet):	5600	8300	
Slope (percent):	2	70	(mostly 20-50%)
Water Table Depth (inches):	none within 60 inches		
Flooding:			
Frequency:	none	none	
Duration:	none	none	
Ponding:			
Depth (inches):	0	0	
Frequency:	none	none	
Duration:	none	none	
Runoff Class:	negligible	low	

Climatic Features

Annual precipitation ranges from 15-19 inches per year. Wide fluctuations may occur in yearly precipitation and result in more dry years than those with more than normal precipitation. Temperatures show a wide range between summer and winter and between daily maximums and minimums. This is predominantly due to the high elevation and dry air, which permits rapid incoming and outgoing radiation. Cold air outbreaks in winter move rapidly from northwest to southeast and account for extreme minimum temperatures. Extreme storms may occur during the winter, but most severely affect ranch operations during late winter and spring.

Prevailing winds are from the southwest, and strong winds are less frequent than over other areas of Wyoming. Occasional storms, however, can bring brief periods of high winds with gusts exceeding 50 mph.

Growth of native cool season plants begins about May 15 and continues to about August 15.

The following information is from the "Jackson" climate station:

Site Type: Rangeland
MLRA: 43B-Central Rocky Mountains

Loamy (Ly) 15-19W
R043BY222WY

	<u>Minimum</u>	<u>Maximum</u>	<u>5 yrs. out of 10 between</u>
Frost-free period (days):	12	60	July 9 – August 12
Freeze-free period (days):	42	100	June 20 – August 26

Annual Precipitation (inches): <11.98 >19.69 (2 years in 10)

Mean annual precipitation: 17.00 inches

Mean annual air temperature: 38.9°F (23.3°F Avg. Min. to 54.5°F Avg. Max.)

For detailed information visit the Natural Resources Conservation Service National Water and Climate Center at <http://www.wcc.nrcs.usda.gov/cgibin/state.pl?state=wy> website. Other climate stations representative of this precipitation zone include "Afton" in Lincoln County; and "Darwin Ranch" in Teton County.

Influencing Water Features

Wetland Description:	<u>System</u>	<u>Subsystem</u>	<u>Class</u>	<u>Sub-class</u>
None	None	None	None	None

Stream Type: None

Representative Soil Features

The soils of this site are moderately deep (greater than 20" to bedrock) to very deep and well-drained with textures ranging from very fine sandy loams through clay loams. Some soils have a lime horizon below 3 feet. The overlying soil is usually noncalcareous.

Major Soil Series correlated to this site includes: Pinedale, Midfork, Amsden, Teeler, Gelkie, Sublette, Buckskin, Driggs, Dranyon, Hobacker, Greyback, Thayne, Willow Creek, Slipman, Bearmouth, Buffork, Boulder, Millerlake, and Tineman series.

Parent Material Kind: alluvium and residuum

Parent Material Origin: sedimentary rock

Surface Texture: loam, clay loam, fine sandy loam, silt loam

Surface Texture Modifier: gravelly

Subsurface Texture Group: loam, clay loam, sandy clay loam, silty clay loam

Surface Fragments ≤ 3" (% Cover): 0-20

Surface Fragments > 3" (%Cover): 0

Subsurface Fragments ≤ 3" (% Volume): 0-10

Subsurface Fragments > 3" (% Volume): 0-5

	<u>Minimum</u>	<u>Maximum</u>
Drainage Class:	moderately well	well
Permeability Class:	moderately slow	moderate
Depth (inches):	20	>60
Electrical Conductivity (mmhos/cm) ≤20":	0	8
Sodium Absorption Ratio ≤20":	0	5
Soil Reaction (1:1 Water) ≤20":	6.6	8.4
Soil Reaction (0.1M CaCl2) ≤20":	NA	NA
Available Water Capacity (inches) ≤30":	2.5	6.0
Calcium Carbonate Equivalent (percent) ≤20":	0	15

Plant Communities

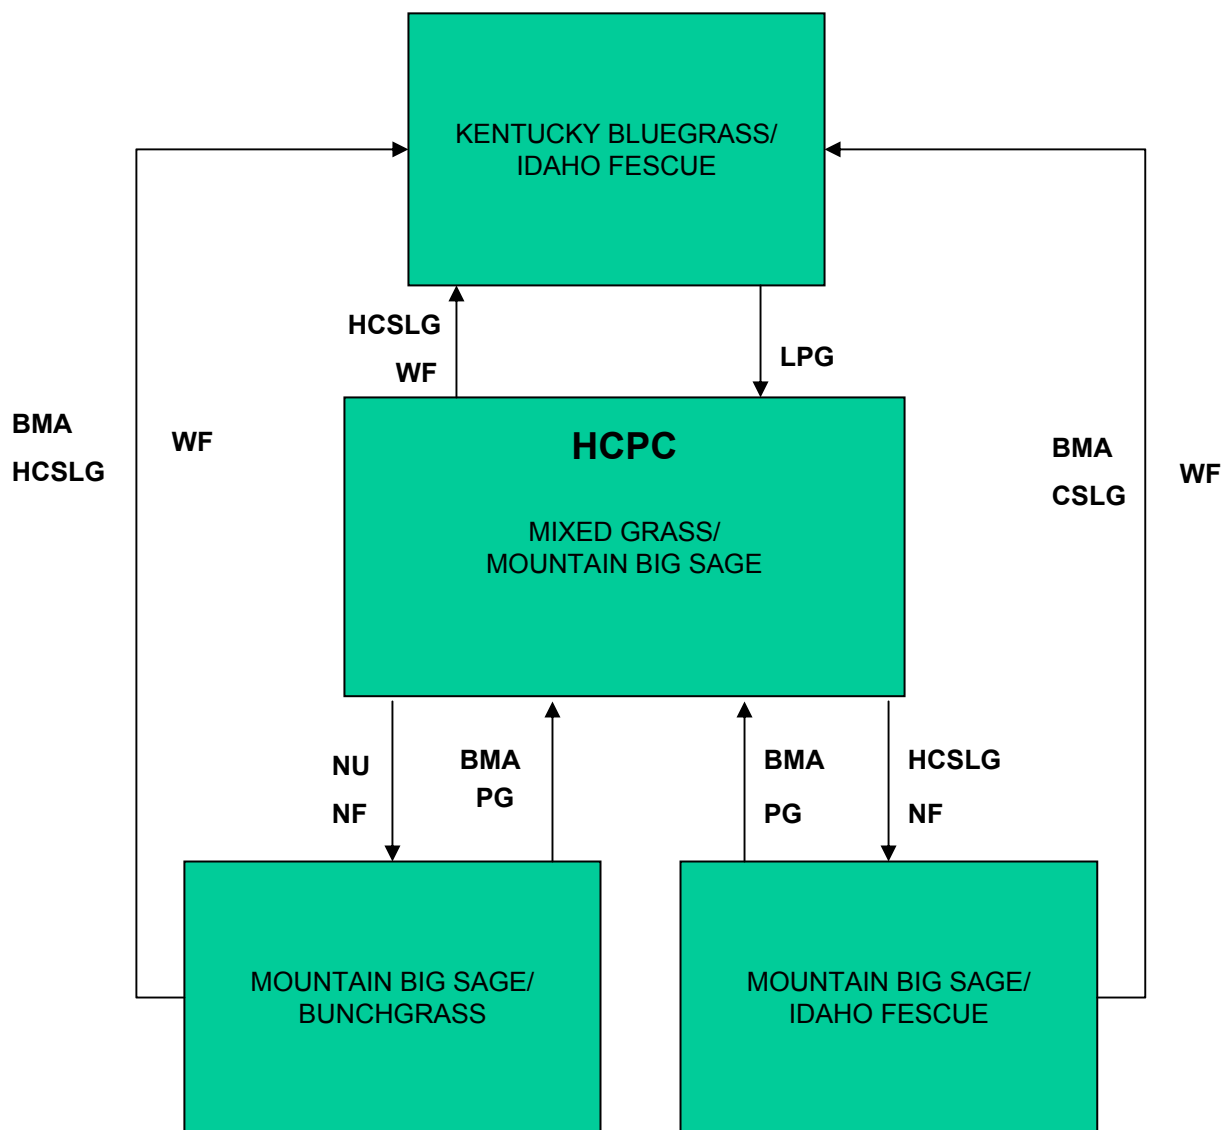

Ecological Dynamics of the Site:

As this site deteriorates because of a combination of frequent and severe grazing, species such as mountain big sagebrush, buckwheat, and yarrow will increase. Less palatable grasses such as Letterman needlegrass, Idaho fescue, rhizomatous wheatgrass, and Sandberg bluegrass also increase. Kentucky bluegrass often invades. Cool-season grasses such as bluebunch wheatgrass, blue wildrye, mountain brome, Columbia needlegrass, and spike fescue will decrease in frequency and production.

Mountain big sagebrush will become dominant with the absence of fire. Wildfires are often actively controlled so chemical control using herbicides has replaced the historic role of fire on this site. Recently, prescribed burning has regained some popularity.

The Historic Climax Plant Community (description follows the plant community diagram) has been determined by study of rangeland relic areas, or areas protected from excessive disturbance. Trends in plant communities going from heavily grazed areas to lightly grazed areas, seasonal use pastures, and historical accounts have also been used.

The following is a State and Transition Model Diagram that illustrates the common plant communities (states) that can occur on the site and the transitions between these communities. The ecological processes will be discussed in more detail in the plant community narratives following the diagram.

BMA – Brush Management (all methods)
BMC – Brush Management (chemical)
BMF – Brush Management (fire)
BMM – Brush Management (mechanical)
CSP – Chemical Seedbed Preparation
CSLG – Continuous Season-long Grazing
DR – Drainage
CSG – Continuous Spring Grazing
HB – Heavy Browse
HCSLG – Heavy Continuous Season-long Grazing
HI – Heavy Inundation
LPG – Long-term Prescribed Grazing
MT – Mechanical Treatment (chiseling, ripping, pitting)

NF – No Fire
NS – Natural Succession
NWC – Noxious Weed Control
NWI – Noxious Weed Invasion
NU – Nonuse
P&C – Plow & Crop (including hay)
PG – Prescribed Grazing
RPT – Re-plant Trees
RS – Re-seed
SGD – Severe Ground Disturbance
SHC – Severe Hoof Compaction
WD – Wildlife Damage (Beaver)
WF – Wildfire

Plant Community Composition and Group Annual Production

green rabbitbrush	Chrysothamnus viscidiflorus	CHVI8	10	0 - 100	0 - 5
serviceberry	Amelanchier alnifolia	AMAL2	10	0 - 100	0 - 5
silver sagebrush	Artemisia cana	ARCA13	10	0 - 100	0 - 5
western snowberry	Symphoricarpos occidentalis	SYOC	10	0 - 100	0 - 5

This list of plants and their relative proportions are based on near normal years. Fluctuations in species composition and relative production may change from year to year dependent upon precipitation or other climatic factors.

Plant Community Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they probably are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more data is collected, some of these plant communities may be revised or removed, and new ones may be added. None of these plant communities should necessarily be thought of as "Desired Plant Communities". According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC's) will be determined by the decision-makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

Mixed Grass/Mountain Big Sage Plant Community (HCPC)

The interpretive plant community for this site is the Historic Climax Plant Community. This state evolved with grazing by large herbivores and is well suited for grazing by domestic livestock. Potential vegetation is estimated at 75% grasses or grass-like plants, 15% forbs, and 10% woody plants. The major grasses include bluebunch wheatgrass, Idaho fescue, blue wildrye, mountain brome, Canby bluegrass, and spike fescue. Other grasses and grasslikes may include big, mutton, and Sandberg bluegrass, basin wildrye, prairie junegrass, bottlebrush squirreltail, Letterman, western, and Columbia needlegrass, sun sedge, California and timber oatgrass, slender and thickspike wheatgrass, and nodding brome. Mountain big sagebrush is the dominant woody plant. Other woody species may include bitterbrush, snowberry, serviceberry, silver sagebrush, and green rabbitbrush.

A typical plant composition for this state consists of bluebunch wheatgrass 10-25%, Idaho fescue 10-25%, blue wildrye 5-10%, mountain brome 5-10%, spike fescue 5-10%, Canby bluegrass 5-10%, other grasses and grass-like plants 10-25%, perennial forbs 10-20%, mountain big sagebrush 1-10%, and up to 5% other woody species. Ground cover, by ocular estimate, varies from 55-60%.

The total annual production (air-dry weight) of this state is about 2000 lbs./acre, but it can range from about 1400 lbs./acre in unfavorable years to about 2400 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0201

Growth curve name: 15-19W, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	10	35	30	20	5	0	0	0

(Monthly percentages of total annual growth)

This plant community is extremely stable and well adapted to the Central Rocky Mountains climatic conditions. The diversity in plant species allows for high drought tolerance. This is a sustainable plant community (site/soil stability, watershed function, and biologic integrity).

Transitions or pathways leading to other plant communities are as follows:

- Nonuse and No Fire will convert this plant community to the *Mountain Big Sage/Bunchgrass State*.
- Heavy Continuous Season-long Grazing and No Fire will convert this plant community to the *Mountain Big Sage/Idaho Fescue State*.
- Wildfire with Heavy Continuous Season-long Grazing will convert this plant community to the *Kentucky Bluegrass/Idaho Fescue State*.

Mountain Big Sage/Bunchgrass Plant Community

This plant community is the result of long-term protection from grazing and fire. Wyoming big sagebrush dominates the site, often exceeding 20-50% annual production and lowering herbaceous forage production. Bunchgrasses such as bluebunch wheatgrass, blue wildrye, Columbia needlegrass, Idaho fescue, and mountain brome dominate the understory.

The total annual production (air-dry weight) of this state is about 1600 pounds per acre, but it can range from about 800 lbs./acre in unfavorable years to about 2200 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0201

Growth curve name: 15-19W, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	10	35	30	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is stable and protected from excessive erosion. The biotic integrity of this plant community is usually intact, however forage value will decrease and wildlife values will shift toward different species. The watershed is functioning.

Transitional pathways leading to other plant communities are as follows:

- Brush Management followed by deferment for 1 to 2 years as part of a Prescribed Grazing plan will return this state to near *Historic Climax Plant Community (Mixed Grass/Mountain Big Sage State)*. Care should be taken when planning brush management to consider wildlife habitat and critical winter ranges.
- Brush Management or Wildfire followed by Heavy Continuous Season-long Grazing will convert this plant community to the *Kentucky Bluegrass/Idaho Fescue State*.

Mountain Big Sage/Idaho Fescue Plant Community

This plant community is the result of heavy, continuous season-long grazing and protection from fire. Mountain big sagebrush eventually dominates this plant community with its annual production often exceeding 50%. Forbs such as yarrow, phlox, lupine, larkspur, buckwheat, and pussytoes increase. Grasses such as Idaho fescue, Sandberg and mutton bluegrass, Letterman needlegrass, and rhizomatous wheatgrass increase in proportion to other grasses.

The total annual production (air-dry weight) of this state is about 950 pounds per acre, but it can range from about 400 lbs./acre in unfavorable years to about 1500 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0201

Growth curve name: 15-19W, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	10	35	30	20	5	0	0	0

(Monthly percentages of total annual growth)

Soil erosion is accelerated because of increased bare ground. The biotic community has been compromised, but is relatively stable. The watershed is functioning, but is at risk of further

degradation. Water flow patterns and pedestals are obvious. Infiltration is reduced and runoff is increased.

Transitional pathways leading to other plant communities are as follows:

- Brush Management followed by deferment for 1 to 2 years as part of a Prescribed Grazing plan will return this state to near *Historic Climax Plant Community (Mixed Grass/Big Sage State)*. Care should be taken when planning brush management to consider wildlife habitat and critical winter ranges.
- Brush Management or Wildfire followed by Heavy Continuous Season-long Grazing will convert this plant community to the *Kentucky Bluegrass/Idaho Fescue State*.

Kentucky Bluegrass/Idaho Fescue Plant Community

This plant community is the result of brush management or wildfire followed by improper grazing management practices. With sagebrush removed, it is dominated by sprouting shrubs such as green rabbitbrush or sometime three-tip sage. Rhizomatous wheatgrasses, low growing bunchgrasses such as Letterman needlegrass and Sandberg bluegrass, and unpalatable annual and perennial forbs dominate the herbaceous understory. Forbs such as prairie smoke, lupine, and thistles are common. There is a substantial amount of bare ground.

The total annual production (air-dry weight) of this state is about 500 pounds per acre, but it can range from about 200 lbs./acre in unfavorable years to about 800 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0201

Growth curve name: 15-19W, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	10	35	30	20	5	0	0	0

(Monthly percentages of total annual growth)

The soil is not protected and erosion will increase if management is not changed. The biotic integrity may be reduced due to low vegetative production. The watershed is functioning at risk.

Transitions or pathways leading to other plant communities are as follows:

- Long-term Prescribed Grazing plan may eventually return this state to near *Historic Climax Plant Community (Mixed Grass/Mountain Big Sage State)*.

Ecological Site Interpretations

Animal Community – Wildlife Interpretations

Mixed Grass/Mountain Big Sage Plant Community (HCPC): This plant community provides suitable thermal and escape cover for mule deer, elk, and antelope. Sagebrush, which can approach 15% protein and 40-60% digestibility, provides important winter forage for mule deer and elk. Year-round habitat is provided for many sagebrush obligate species such as the sage grouse, sage sparrow, Brewer's sparrow, sage thrasher, pygmy rabbit, sagebrush vole, horned lizard, and pronghorn antelope. Other birds that would frequent this plant community include horned larks and golden eagles.

Mountain Big Sage/Bunchgrass Plant Community: This plant community may be useful for the same wildlife that would use the Historic Climax Plant Community.

Mountain Big Sage/Idaho Fescue Plant Community: This plant community may be beneficial for the same wildlife that would use the Historic Climax Plant Community. However, the plant community composition is less diverse, and thus, less apt to meet the seasonal needs of these animals.

Kentucky Bluegrass/Idaho Fescue Plant Community: This plant community provides limited forage for elk and mule deer due to low production and lack of sagebrush.

Animal Preferences (Quarterly - 1,2,3,4) for commonly occurring plants in MLRA 43B, 15-19W

Animal Community – Grazing Interpretations

The following table lists suggested stocking rates for cattle under continuous season-long grazing under normal growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of the conservation planning process. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this, a field visit is recommended, in all cases, to document plant composition and production. More precise carrying capacity estimates should eventually be calculated using this information along with animal preference data, particularly when grazers other than cattle are involved. Under more intensive grazing management, improved harvest efficiencies can result in an increased carrying capacity. If distribution problems occur, stocking rates must be reduced to maintain plant health and vigor.

Plant Community	Production (lb./ac)	Carrying Capacity* (AUM/ac)
Mixed Grass/Big Sage (HCPC)	1400-2400	.6
Mountain Big Sage/Bunchgrass	800-2200	.5
Mountain Big Sage/Idaho Fescue	400-1500	.3
Kentucky Bluegrass/Idaho Fescue	200-800	.15

* - Continuous, season-long grazing by cattle under average growing conditions.

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage for cattle, sheep, or horses. During the dormant period, the forage for livestock use needs to be supplemented with protein because the quality does not meet minimum livestock requirements.

Hydrology Functions

Water is the principal factor limiting forage production on this site. This site is dominated by soils in hydrologic group B, with localized areas in hydrologic groups A and C. Infiltration ranges from rapid to moderate. Runoff potential for this site varies from low to moderate depending on soil hydrologic group and ground cover. In many cases, areas with greater than 75% ground cover have the greatest potential for high infiltration and lower runoff. Areas where ground cover is less than 50% have the greatest potential to have reduced infiltration and higher runoff (refer to Part 630, NRCS National Engineering Handbook for detailed hydrology information).

Rills and gullies should not typically be present. Water flow patterns should be barely distinguishable if at all present. Pedestals are only slightly present in association with bunchgrasses and shrubs. Litter typically falls in place, and signs of movement are not common. Chemical and physical crusts are rare to non-existent. Cryptogamic crusts are present, but only cover 1-2% of the soil surface.

Recreational Uses

This site provides hunting opportunities for upland game species. The wide variety of plants which bloom from spring until fall have an esthetic value that appeals to visitors.

Wood Products

No appreciable wood products are present on the site.

Supporting Information

Associated Sites

Shallow Loamy	R043BY262WY
Clayey	R043BY204WY
Overflow	R043BY230WY

Similar Sites

R034AY222WY – Loamy (Ly) 10-14W has lower production and lacks Idaho fescue, spike fescue, mountain brome, and Columbia needlegrass.

R043BY204WY – Clayey (Cy) 15-19W has heavier soil textures and more rhizomatous wheatgrass and less overall diversity.

Inventory Data References (narrative)

Information presented here has been derived from NRCS clipping data and other inventory data. Field observations from range trained personnel were also used. Those involved in developing this site include: Bill Christensen, Range Management Specialist, NRCS; Karen Clause, Range Management Specialist, NRCS; and Everet Bainter, Range Management Specialist, NRCS. Other sources used as references include: USDA NRCS Water and Climate Center, USDA NRCS National Range and Pasture Handbook, and USDA NRCS Soil Surveys from various counties.
